There are many different versions, and many of them still run on devices today. Keeping up with the latest version can be a challenge, but don't get annoyed – we've covered you. RELATED: Fragmentation is not Android error. It is the main Android versions of manufacturers are usually released once a year (although it was not always so), with monthly security updates released between. Occasionally, Google also releases point updates (1, 2, etc.), although these usually come without regularity. Often more important updates, which are not quite as important as full version versions, justify a point update, such as B the update from Android 8.0 to Android 8.1. Next to each Android version is a code name that many people use instead of the version number. Each is named after a dessert or other form of ready-made, which is more for fun than anything else. A Brief Android Version History We thought it appropriate to give a short rundown of each Android version to the accompanying code name and release date. You know, the completeness. Android 1.5, Cupcake: April 27, 2009 Android 1.6, Donut: September 15, 2009 Android 2.0-2.1, Eclair: October 26, 2009 (First Release) Android 2.2-2.2.3, Froyo: May 20, 2010 (First Release) Android 2.3-2.3.7, Gingerbread: December 6, 2010 (first release) Android 3.0-3.2.6, Honeycomb: February 22, 2011 (first release) Android 4.0-4.0.4, Ice Cream Sandwich: October 18, 2011 (first release) Android 4.1-4.3.1, Jelly Bean: July 9, 2012 (first release) Android 4.4-4.4.4.4.4 , KitKat: October 31, 2013 (First Release) Android 5.0-5.1.1 , Lollipop: November 12, 2014 (first release) Android 6.0-6.0.1, Marshmallow: October 5, 2015 (first release) Android 7.0-7.1.2, Nougat: 22. August 2016 (first release) Android 8.0-8.1, OreO: August 21, 2017 (first release) Android 9.0, Pie: August 6, 2018 Android 10.0: September 3, 2019 Android 11.0: September 8, 2020 As you can see, the update system was early without any regularity, but the Ice Cream Sandwich era began the annual update schedule for the operating system version. A few other funny notes: Honeycomb was the only tablet-specific version of Android, and it ran alongside the gingerbread build for phones. The separate phone and tablet OSes were then combined from Ice Cream Sandwich. Ice Cream Sandwich was arguably the most dramatic update for Android to date. It not only combined the tablet and phone versions of the but completely reworked the appearance of the system. Google initially released developer-oriented Nexus devices to highlight the performance of any Android version. This eventually evolved into the consumer-oriented pixel device line Pixel device line have today. Android KitKat has teamed up for the first time with a commercial manufacturer for an Android version. You did it again for Android OreO. The latest version of Android is 11.0 The first version of Android 11.0 was released on September 8, 2020 on Google's Pixel smartphones as well as phones from OnePlus, Xiaomi, Oppo and Realme. Unlike previous versions of Android, this version doesn't have a cute dessert name – or any other type of name that goes beyond the version number. It's just Android 11. Google still plans to use dessert names internally for development builds. For example, Android 11 was codenamed Red Velvet Cake. RELATED: The best new features in Android 11, now available As with Android 10 before that, Android 11 includes a number of new user-related changes and features. Most prominent are an integrated screen recorder, smart home controls in the power menu, redesigned media controls, and a dedicated messaging notification section. How to Check Your Version of Android Here is the funny part about Android: how to find out even the simplest information varies not only which version of Android your phone is running, but also who made the device. But we will keep it as simple as possible here. Open your phone's settings menu by dragging down the notification shadow and then tapping the gear icon. From there, scroll at the bottom of the menu and tap the About Phone entry (it can also be About Device). If your phone doesn't have this option, it's likely OreO, which has received a pretty dramatic adjustment overhaul. In this case, look for the System option. There should be an entry for Android version – again, depending on the device and Android version, it may be different. On OreO, see the System Update section for version information. How to update to the latest version The short answer is also an unfortunate one: you might not be able. Android updates are first handled by the manufacturer of your phone – so Samsung is responsible for its updates, LG takes care of updating its phone and so on. The only updates that Google itself processes are for Pixel and Nexus devices. RELATED: Why your Android phone doesn't get operating system updates and what you can do about it to see if an update is available for your device, go to Settings > About Device > System Updates (or similar). This can also be in a different location depending on the phone – Samsung places the System Updates option, for example, in the root of the Settings menu. When you tap this option, it searches for an update on the device, but there's a good chance it won't find anything. Once update for your phone, it usually notifies you of this fact and prompts you to download and install it immediately. The only safe way to make sure you get the latest version of Android is to buy from the Pixel line. Google updates these phones directly, and they are usually up to date with the major version major version Security patches. A version number is a unique number or set of numbers assigned to a specific version of a software program, file, firmware, device driver, or even hardware-based numbers. Typically, when updates and completely new editions of a program or driver are released, the version number is increased. Compare the version number of the software installed on your computer with the version number that will be published to see if you have already installed the latest version. Version numbers are typically divided into sets of numbers separated by decimal places. Typically, a change in the left number indicates a significant change in the software or driver. Changes to the right number usually indicate a minor change. Changes in other numbers represent different degrees of change. Google Chrome version number. For example,B, you have installed a program that reports itself as version 3.2.34. The next version of the program may be version 3.2.87, suggesting that several iterations have been internally tested and a slightly improved version of the program is now available. A future version of 3.4.2 would indicate that more extensive updates are included. Version 4.0.2 could be an important new version. There is no official way to version software, but most developers follow these general rules. Sometimes the version of Word is generally used to refer to either a version name or a version number, depending on the context. Some examples of version names are 7 as in Windows 7 and 10 as in Windows 10. The version number of the first version of Windows 7 was 6.1 and for Windows 10 it was 6.4. The Windows version number list contains more about the real version numbers behind Microsoft Windows versions. Version numbers indicate the level at which a particular thing is located—most often software and other important areas of the operating system. Version numbers help to avoid confusion about updating software or not, a very valuable thing in a world of continuous security threats, followed by patches to address these vulnerabilities. The typical way you update software to the latest version number is to visit the developer's Web site and download a new copy to install it from your existing one. Some programs provide an update feature within their software, so updates are delivered to you automatically. Another way to ensure that your third-party software is up to date is with a software updater tool. This is also an easy way to check the current version number of your Programs. Other updater utilities are also available, such as.B. Driver Updater to update device drivers and Windows Update to keep Windows up-to-date. Thank you for letting us know! Tell us why! Mozilla today released the latest release candidate for its Firefox web browser, which is now available for free download. For the Mozilla Foundation and the Firefox community, the release of Release Candidate 3 (RC3) is an important milestone because it provides the final code for the long-awaited 2.0 Browser. If there are no showstoppers, RC3 will be the final version of the Firefox 2.0 release -- said Mike Schroepfer, vice president of engineering for the open source Mozilla Foundation.The first release candidate for Firefox 2.0 became available on September 26, while the second was released on October 6, when developers were looking for additional input and bug reports from users. Even as Firefox 2.0 approaches its debut, work is underway on the next full version of the browser, Firefox 3.0.To help create Firefox 3.0, the development team last week put together a Firefox feature brainstorming website on the Firefox community wiki where developers and beta users can add comments on features they want to see in upcoming versions of the browser. Similar wiki pages were available to users who wanted to offer input on features in Firefox 2.0, but the latest brainstorming wiki page will help formalize new feature requests for all future versions of the browser. Anyone who has a good idea and wants to participate can enter comments on the wiki page, Schroepfer said. We're just looking for as much feedback as people want to give. In the past, we have generally tried to gather ideas. It is part of our work in general. As the release of Firefox 2.0 approaches, the release date for the next release, Firefox 3.0, remains indeterminate. At this point, it's pretty far on the horizon, Schroepfer said of Firefox 3.0. I would think [about a release] at the end of next year. This story, Latest version of Firefox Now available was originally published by Network World.
